### Report Overview

An Automatic Flight Control System (AFCS) is a sophisticated technological system integrated into modern aircraft that is designed to enhance flight safety, efficiency, and pilot workload management. The primary function of an AFCS is to automatically control and stabilize the aircraft's trajectory, attitude, and speed, either by following pre-programmed flight paths or in response to pilot inputs. This system encompasses a range of components, including sensors for altitude, airspeed, and angle of attack, actuators that make adjustments to control surfaces, and a central computer that processes data and sends commands to maintain flight parameters. The AFCS can operate in various modes, such as autopilot for hands-off flying, autothrottle for managing engine power, and flight director systems that guide pilots through complex maneuvers. By automating these critical functions, the AFCS significantly reduces the risk of human error, improves flight performance, and allows pilots to focus on strategic decision-making and overall mission management.
