Abstracts

An automatic blood smear processor is a machine used in medical laboratories to prepare blood samples for analysis. When collecting a blood sample, it is usually placed on a slide and stained for microscopic examination. The process of diffusing blood onto a slide is called a blood smear, which is a key step in preparing a sample for analysis. The automatic blood smear processor automates the preparation process of blood smears, making them faster and more consistent than manual methods. The working principle of this machine is to extract a small amount of blood from a sample tube and disperse it onto a glass slide using a series of rollers. The smear is then dried and stained for examination under a microscope. By automating the preparation process of blood smears, automatic blood smear processors can improve the efficiency and accuracy of laboratory testing, while also reducing the risk of errors and mutations caused by manual processing. This helps improve the quality and reliability of laboratory results, thereby improving patient care.
