Report Overview

A damper actuator (also known as a damper motor) is a device used to control the opening and closing of dampers in HVAC and industrial systems. They are essential for regulating airflow within various ducting and ventilation systems. A damper is a plate or door that can be opened or closed to control airflow or other gases. The actuator is the component that provides the force required to move the damper, allowing for precise control of airflow. It can be driven electrically, pneumatically, or hydraulically, depending on the specific application and requirements. In HVAC systems, damper actuators help control temperature and air quality by regulating the amount of air that flows through the system. By adjusting the position of the damper, the system can control the mix of fresh and recirculated air, maintain a desired temperature, and even control humidity.
