Abstracts

A car anti-vibration bar, also known as a stabilizer bar, anti-roll bar or anti-sway bar, is a component connected to the car's suspension system. It is usually made of metal and runs between the front and rear suspension systems of the vehicle, connecting the left and right suspension devices. Its function is to reduce the body roll when the vehicle turns and improve driving stability and handling. By reducing body roll, anti-vibration stabilizer bars help maintain the wheel's contact patch, improving vehicle stability at high speeds or making sharp turns and reducing the risk of rollover. This is particularly important in high-gravity vehicles such as SUVs and sedans.

The global Automobile Anti Vibration Balance Bar market size was estimated at USD 1250.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
