Abstracts

The principle of the Automotive Auto-Dimming Rearview Mirror is that when a light source hits the mirror, the mirror itself darkens due to electrochromic effect (this is why auto-dimming mirrors are also called electrochromic mirrors). Electrochromic materials change color when charged by an electric current. Apply a voltage through it and it dims. Remove the voltage and the light comes on. This is primarily a chemical reaction triggered by the application of electricity. When electrochromic material is added to an auto-dimming mirror, a voltage changes the way it absorbs and reflects light. Therefore, the Automotive Auto-Dimming Rearview Mirror can improve the driver's driving safety and comfort, especially when driving at night or encountering high-beam lights from oncoming cars. It can effectively reduce the impact of glare on the driver and help the driver stay in good health. vision status.

The global Automotive Auto Dimming Rearview Mirror market size was estimated at USD 1150.45 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.25% during the forecast period.
