Abstracts

Automotive blind spot monitoring radar is an advanced driver assistance system used to improve driving safety. It scans and monitors blind spot areas on both sides of the vehicle in real time through radar sensors installed on both sides of the rear side of the vehicle. These blind spot areas are areas that the driver cannot directly observe through the rearview mirror and side view mirror, and often hide other vehicles or obstacles, which may cause safety hazards. The blind spot monitoring radar system detects vehicles or objects in the blind spot area in real time through millimeter wave radar sensors. When the system detects a potential risk in the blind spot area, the driver will receive a visual or audible warning, such as a warning light on the dashboard or an siren, to alert the driver. With timely warnings, drivers can take appropriate measures to avoid collisions with other vehicles or objects. In addition, blind spot monitoring radar systems are often integrated with other driving assistance systems (such as lane keeping assist, automatic emergency braking, etc.) to provide drivers with more comprehensive safety protection. In some advanced systems, if the driver fails to respond to a warning, the system may automatically apply the brakes or adjust the vehicle's speed to ensure safe driving. The sensitivity of the blind spot monitoring radar system can be adjusted to different driving environments, such as highways or city roads, to avoid unnecessary alerts. With the continuous development of automotive technology, blind spot monitoring radar has become one of the standard or optional features on modern vehicles, providing drivers with a safer and more comfortable driving experience.

The global Automotive Blind Spot Monitor Radar market size was estimated at USD 4528.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.45% during the forecast period.
