Abstracts

Automotive carbon polymer composites refer to a type of composite material used in automobile manufacturing, usually consisting of carbon fiber and a polymer matrix. This material combines the high strength and lightweight properties of carbon fiber with the wear and corrosion resistance of polymers, making it widely used in automotive manufacturing. In automobile manufacturing, carbon-polymer composites are commonly used to manufacture body structures, body panels, interior trim parts, chassis components, and other components that require lightweight and high strength. Compared with traditional metal materials, carbon polymer composites have lighter weight, higher strength and stiffness, and better corrosion resistance, thereby reducing the overall weight of the vehicle, improving fuel efficiency, and improving the vehicle's durability. Performance and security. However, the manufacturing cost of carbon polymer composites is relatively high, so factors such as cost, performance and manufacturing process need to be considered in practical applications. With the development of technology and reduction of costs, the application of carbon polymer composite materials in automobile manufacturing is also increasing.

The global Automotive Carbon Polymer Composites market size was estimated at USD 2850.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.35% during the forecast period.
