Report Overview

The Automotive Fuel Cell System is a cutting-edge technology designed to power vehicles by converting chemical energy from hydrogen into electricity through a chemical reaction with oxygen. This eco-friendly system consists of a fuel cell stack, which facilitates the electrochemical conversion, and various auxiliary components such as a hydrogen storage tank, air compressor, and control systems. The fuel cell stack is the core component, made up of multiple layers including a membrane electrode assembly, bipolar plates, and gas diffusion layers. The system is designed to provide a clean and efficient power source for vehicles, reducing emissions and improving fuel efficiency. It operates by drawing in hydrogen from the storage tank and oxygen from the air, combining them within the fuel cell to produce electricity, which then powers the vehicle's electric motor. The only byproduct of this process is water, making it a sustainable and environmentally friendly alternative to traditional internal combustion engines.
