Report Overview

Automotive glass fuses are a type of fuse used to protect the electrical circuits in vehicles. They are commonly installed in the vehicle's fuse box or fuse panel and serve as a safety device to prevent damage or fire risks caused by circuit overloads or short circuits. Automotive glass fuses consist of a glass tube with metal contacts at each end. The glass tube acts as insulation and protection, while the metal contacts serve as the current-carrying components. When a circuit experiences an overload or short circuit, the current rapidly increases, causing the metal inside the fuse to melt and break the circuit. This interrupts the flow of electricity, protecting the vehicle's electrical system and related devices. The fuse is then considered "blown" or "burned out" and needs to be replaced with a new automotive glass fuse to restore electrical power to the circuit.
