Abstracts

An Automotive Self-Piercing Rivet (SPR) is a type of fastener used in the automotive industry to join two or more layers of metal or other materials without the need for pre-drilled holes. It is designed to pierce through the material being joined, creating a secure bond by forming a mechanical clinch. In recent years, with the continuous development and technological innovation of the automotive industry, automotive self-piercing rivets (SPR) as an important connection technology have been widely used in the field of automobile manufacturing, especially in terms of body structure, lightweight, corrosion resistance and manufacturing efficiency. Self-piercing rivet technology takes advantage of its advantage of not requiring pre-drilling, making the manufacturing process more efficient and effectively improving the overall strength and stability of the body, and gradually becoming an ideal choice to replace traditional welding and other connection methods. At present, the global automotive self-piercing rivet market is in a rapid development stage, especially in major automobile manufacturing regions such as Europe, North America and China. With the continuous improvement of automobile manufacturers' requirements for high strength, lightweight and safety, traditional welding and bolt connection methods are gradually replaced by self-piercing rivets, especially in the manufacture of aluminum alloy bodies, mixed material body structures and all-electric vehicles (EVs), automotive self-piercing rivets play an important role. Self-piercing rivet technology can easily connect different types of metals or composite materials together, providing greater flexibility for automobile design. The application of self-piercing rivets has many advantages: first, the riveting process does not require pre-punching, which not only reduces production costs but also improves production efficiency; second, the strength and durability of the connected parts after riveting can meet the strict requirements of modern automobiles in terms of safety and collision protection. In addition, since it can be used to combine a variety of different materials, self-piercing rivets are particularly suitable for multi-material splicing such as aluminum

alloys, steel and composite materials in modern automobile manufacturing, especially for the manufacture of lightweight electric vehicles.

The global Automotive Self-Piercing Rivet market size was estimated at USD 1369.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.20% during the forecast period.
