Abstracts

Hybrid-drive underwater glider is a new type of underwater glider that improves navigational positioning accuracy and maneuverability by adding fin rudder and propeller propulsion system, which makes up for the deficiency of underwater glider to a certain extent. Underwater glider is a new type of underwater robot driven by buoyancy, with low energy consumption and low noise. The cost is low, it meets the needs of long-term and large-scale ocean exploration, and it also has important military application value. However, because the underwater glider also has a low sailing speed and a complex marine environment, it is vulnerable to the influence of wind, waves and currents, and its track and positioning accuracy are low.

The global Autonomous Hybrid Driven Underwater (Hug) Gliders market size was estimated at USD 152.3 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.45% during the forecast period.
