Report Overview

Avalanche Photodetector APD is a semiconductor photodetector that operates by utilizing the avalanche effect to achieve a high internal current gain, typically ranging from hundreds to thousands. This effect allows APDs to be significantly more sensitive in detecting low-intensity optical signals than conventional photodiodes. When a high reverse voltage is applied across an APD, photo-generated electrons gain additional energy under the influence of the electric field, triggering an avalanche breakdown and leading to the production of more electron-hole pairs. These pairs are further separated in the electric field, resulting in increased current output. APD's high gain characteristics make it crucial for applications such as single-photon detection, laser ranging, and long-distance fiber optic communications.
