Report Overview

A turboprop engine (or turboprop jet engine, or turboprop engine, depending on the engine type) is a gas turbine engine commonly used in aircraft. The driving principle of a turboprop engine is roughly the same as that of a traditional propeller aircraft that uses a piston engine as its power source. The force generated when the propeller rotates is used as the propulsion force for the aircraft to move forward. The main difference between this and a piston propeller is not only the power source that drives the central axis of the propeller, but also that the gas turbine of the turboprop engine usually runs at a constant speed, while the piston-powered propeller will rotate according to the engine speed. Different speeds vary.
