Report Overview

Azacitidine for Injection is a chemotherapy drug primarily used to treat myelodysplastic syndromes (MDS), a group of bone marrow disorders that can lead to leukemia, as well as acute myeloid leukemia (AML). It functions as a hypomethylating agent, altering DNA methylation to restore normal gene function and inhibit abnormal cell proliferation. The drug is administered intravenously or subcutaneously and is often prescribed for patients unsuitable for aggressive chemotherapy due to age or comorbidities. Market demand is driven by an aging population, increasing MDS and AML diagnoses, and its inclusion in treatment guidelines as a first-line therapy. Competition includes generic versions and alternative hypomethylating agents like decitabine. Pricing pressures exist due to healthcare cost containment policies, but patent expirations and biosimilar developments influence market dynamics. Growth opportunities lie in expanding indications, combination therapies, and emerging markets with improving healthcare infrastructure.
