Report Overview

A Baby Artificial Resuscitator is a medical device specifically designed for infants and newborns to assist in the process of resuscitation when they are not breathing or have a weak respiratory effort. This device is typically used in emergency situations or immediately after birth when a baby requires immediate medical intervention to ensure proper oxygenation. The resuscitator works by providing positive pressure ventilation, which helps to inflate the baby's lungs and stimulate breathing. It may be equipped with a mask that fits over the baby's nose and mouth, or it may be designed for intubation, where a tube is inserted into the baby's airway. The device is operated by a healthcare professional who controls the flow of oxygen and the pressure applied, ensuring the baby receives the necessary support for respiration until they can breathe independently or their condition stabilizes.
