Report Overview

Back pressure turbines utilize the pressure differential between the intake steam and the expelled steam to efficiently convert part of the thermal energy of the steam into mechanical energy. The exhaust pressure is designed to be higher than atmospheric pressure, and the heat energy of the exhaust steam is reused for the factory's processes. Back pressure turbines are available in single stage or multi-stage options. Primarily, this kind of turbine is used as a reducing station between boiler unit and the process steam header. Back pressure turbines are commonly employed in industrial plants where a large quantity of steam is required.
