Report Overview

A Ball Coagulometer is a laboratory instrument used to measure the coagulation properties of blood. It utilizes a rotating metal or glass ball that is immersed in a sample of blood or plasma. As the ball rotates, it generates shear stress on the blood, initiating the clotting process. The instrument measures the time taken for the formation of a fibrin clot, known as the clotting or coagulation time, which is an essential indicator of the blood's ability to clot properly. Ball Coagulometers are often used in clinical laboratories to diagnose and monitor bleeding disorders, assess anticoagulant therapy, and evaluate coagulation profiles.
