Abstracts

Ball grid array (BGA) components are relatively new and more complex technologies, which gradually replace the dual in-line packaging technology (DIP) or traditional flat packaging technology. During the BGA assembly process, it is important to note that it is under the packaging, so it is not visible to the naked eye. For this reason, we need not only high-quality welding processes, but also BGA inspections to ensure optimization and reliability. BGA testing is to analyze the connection between the chip and the PCB. In BGA, we must check various aspects of assembly, such as the height of the package, check the size of popcorn and continuous monitoring terminal. This can be done using various techniques, such as: optical inspection, mechanical inspection, X-ray inspection. Optical inspection can be accomplished by using an endoscope to closely observe the connection between the ball grid array and the PCB surface. There are equipment for optical inspection on the market. These systems allow us to clearly understand the connection between the PCB and the chip, from which we can evaluate the quality of the process. BGA mechanical testing is a destructive process. Most destructive mechanical tests are done through impact testing, where the entire assembly is subjected to impact and shear, and then the mechanical properties of the solder joint are evaluated by measuring strain.

The global Ball Grid Array Bga Inspection Equipment market size was estimated at USD 350.45 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.75% during the forecast period.
