### Report Overview

Basement membrane extract gel is a specialized biological matrix derived from the basement membrane of tissues, primarily composed of extracellular matrix (ECM) proteins such as collagen IV, laminin, entactin, and heparan sulfate proteoglycans. It mimics the natural microenvironment of cells and is widely used in cell culture, tissue engineering, and regenerative medicine to support cell adhesion, proliferation, and differentiation. The gel provides a 3D scaffold that closely resembles in vivo conditions, making it valuable for research in cancer biology, stem cell studies, and organoid development. Its applications also extend to drug screening and wound healing models, where simulating native tissue architecture is critical. The product is typically sourced from Engelbreth-Holm-Swarm (EHS) mouse sarcoma or human-derived matrices, with variations in composition influencing its suitability for specific experimental or therapeutic purposes.
