Abstracts

The high temperature cracking technology of lithium batteries requires the use of an oxygen-free cracking furnace (also called a high temperature pyrolysis furnace). The gas in this high temperature cracking furnace is protected by inert gas. The high temperature anaerobic pyrolysis technology performs anaerobic pyrolysis on the organic matter of waste lithium-ion batteries. The pyrolysis of the material in the pyrolysis furnace is an external heating roasting. The heat source does not contact the solid material. It is an indirect heating in a closed system to ensure that the pyrolysis gas does not leak out. The pyrolysis conditions are 450-600? in an inert gas atmosphere.

The global Battery High Temperature Pyrolysis Furnace market size was estimated at USD 850.25 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.45% during the forecast period.
