Abstracts

Battery ultrasonic non-destructive testing (NDT) is a professional service that utilizes ultrasonic technology to inspect the internal structure and assess defects of various batteries (such as power batteries, energy storage batteries, and consumer electronics batteries) during production or use. This service identifies internal defects such as pores, cracks, delamination, welding defects, and material inhomogeneities in batteries through non-contact methods, thereby ensuring battery safety, performance stability, and lifespan. It is widely used in R&D, production quality inspection, after-sales testing, and safety assessment. The downstream clients of battery ultrasonic NDT services mainly include power battery manufacturers (new energy vehicles, energy storage systems), consumer electronics battery manufacturers, third-party testing institutions, and research and quality control laboratories. These clients need to ensure that batteries are free of internal defects during production and use to guarantee safety, reliability, and performance stability. Downstream services are mostly technology-intensive and high-value-added businesses with high gross margins: the gross margin for standardized batch testing services is generally around 53%. Battery ultrasonic nondestructive testing services play a vital role in modern battery manufacturing and maintenance. Through high-precision ultrasonic technology, this service can accurately identify potential defects inside the battery, thereby effectively preventing failures and improving product quality. With the continuous advancement of battery technology and the expansion of application areas, ultrasonic nondestructive testing can not only ensure the safety and reliability of batteries, but also help companies improve production efficiency and reduce maintenance costs. In the future, with the continuous innovation of testing technology, this service will become more important and provide more reliable battery solutions for all walks of life.
