Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on BC Battery Slurry competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global BC Battery Slurry production reached approximately 242 tons, with an average global market price of around US\$926 per kilogram. BC Battery Slurry refers to conductive paste specifically designed for Back Contact (BC) solar cells, mainly silver paste. It enables rear-side electrode interconnection with high conductivity, strong adhesion, and low-temperature sintering properties, supporting the high-efficiency performance of BC cell technologies. This report counts BC solar cell silver paste. The upstream of BC battery slurry mainly includes metal raw materials and chemical additives precious metal raw materials, such as high-purity silver powder, glass powder (low-melting point glass), organic carriers, dispersants, adhesives, etc.; the downstream is BC solar cell manufacturers, such as Aixun Co., Ltd. and Longi Green Energy. 1. PERC cells entered mass production in 2017, reaching a 65% market share in 2019 and becoming the mainstream until being surpassed by TOPCon in 2024. We estimate that the market share of PERC cells, which previously dominated, will drop from 24% in 2024 to 8% in 2025, and will be less than 0.2% in 2030. TOPCon cells, the new mainstream cell type, will see their market share rise from 72% in 2024 to 82% in 2025, while BC cells will see their market share rise from 4% in 2024 to 8% in 2025, reaching 25% in 2030. 2. In the future, new solar cells will gradually dominate the photovoltaic industry. Back contact (BC) cells differ materially from traditional single-sided cells because they collect irradiance on both the front and rear faces, which requires metallization and electrode preparation on both sides. That inherently raises the demand for conductive materials such as photovoltaic silver paste in the near term. However, two important sources of uncertainty could moderate that demand growth: first, material innovation (for example,

low-silver or silver-free conductive alternatives) may reduce per-unit silver consumption; second, evolving cell and module architectures could alter metallization patterns and material intensity. In short, under current technical pathways BC adoption is a clear upward driver for silver-paste demand, but medium-to-long-term material and design innovations could change the trajectory.³ From a performance-and-cost perspective, BC cells deliver measurable generation gains but introduce additional process complexity and cost. Performance improvements stem from higher short-circuit current density, expanded rear-side metallization that lowers series resistance, and greater scope for front-surface passivation and optical optimization? factors that together raise photoelectric conversion efficiency. Under comparable constraints, BC modules are estimated to deliver roughly +1 percentage point in absolute efficiency versus mainstream TOPCon modules, increase installed capacity per unit area by about 4.76%, and boost lifecycle energy output by approximately 8%. Conversely, the more intricate manufacturing flow increases processing difficulty, impacts yield, and raises unit production costs? key bottlenecks for large-scale rollout. At present, Longi and Aiko are among the most advanced in BC commercialization and are expected to lead initial volume ramping in 2025, while many other manufacturers are adopting a follower strategy with slower progress.

The global BC Battery Slurry market size was estimated at USD 224.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 20.30% during the forecast period.
