Report Overview

Bellows air springs are a type of pneumatic actuator that uses a flexible, accordion-like rubber bellows to provide a cushion of air for various applications. These air springs are commonly used in vehicles, industrial machinery, and other equipment to provide a smooth and adjustable suspension system. The bellows air spring works by using compressed air to inflate the bellows, which then provides a cushioning effect to absorb shocks and vibrations. This allows for a smoother ride and better control of the equipment, as well as reducing wear and tear on the machinery. These air springs are also known for their ability to provide adjustable support, as the air pressure can be easily adjusted to accommodate different loads and operating conditions. This makes them ideal for applications where variable loads or weight distribution are a factor. Overall, bellows air springs are a versatile and reliable solution for providing cushioning and support in a wide range of applications, making them a popular choice for many industries. Bellows style air springs are made from heavy-duty reinforced rubber, which is configured with either one, or multiple convoluted chambers. Bellows air bags are typically larger than sleeve style air springs, giving them more lifting and load handling capacity. The design of most bellows air springs allows the air spring to be inflated to the desired firmness, and then deflated in similar fashion.
