### Report Overview

A Below Knee Prosthesis, also known as a transtibial prosthesis, is a medical device designed to replace the function of a lower limb that has been amputated below the knee. This prosthetic device is custom-made to fit the residual limb of the individual, ensuring a comfortable and secure fit. It typically consists of a socket that attaches to the residual limb, a pylon or shank that acts as the artificial leg, and a foot component that provides support and mobility. The Below Knee Prosthesis is engineered to mimic the natural movement of the human leg, allowing the user to walk, run, and perform various daily activities with minimal limitations. The design may incorporate advanced materials and technologies, such as carbon fiber for lightweight strength, microprocessor-controlled knee joints for improved stability and flexibility, and shock-absorbing components for enhanced comfort. The primary goal of a Below Knee Prosthesis is to restore mobility and independence to individuals who have experienced limb loss, improving their quality of life and enabling them to engage in a wide range of physical activities.
