### Report Overview

Bendamustine hydrochloride powder is a chemotherapeutic agent primarily used to treat chronic lymphocytic leukemia (CLL) and indolent B-cell non-Hodgkin lymphoma (NHL). It belongs to the alkylating agent class, combining properties of purine analogs and alkylators to disrupt DNA synthesis and repair, leading to cancer cell death. The drug is administered intravenously after reconstitution and is often preferred for its efficacy in relapsed or refractory cases, as well as its relatively manageable side-effect profile compared to traditional chemotherapy. The market for bendamustine hydrochloride powder is driven by increasing cancer prevalence, particularly hematologic malignancies, and its adoption in combination therapies. However, competition from biosimilars and novel targeted therapies, along with patent expirations, poses challenges to market growth.
