Abstracts

Benign prostatic hyperplasia (BPH) is a prostate enlargement caused by excessive cell growth in the prostate. BPH is a benign (non-cancerous) prostate condition. Non-cancerous conditions are not usually fatal and do not spread (metastasize) to other body parts. BPH doesn't raise the risk of prostate cancer; unless it manifests symptoms, BPH isn't considered a health issue. Almost all men will have some prostate growth by the age of 70. Getting older, having more belly fat (also known as abdominal obesity), and not getting enough exercise to raise the risk of developing BPH.
