Report Overview

Bentonite waterstop is a specialized construction material designed to control water flow and prevent leakage in concrete joints, expansion gaps, and other structural seams. It consists of sodium bentonite clay, a naturally absorbent material that swells upon contact with water, forming a flexible, impermeable barrier. This product is widely used in below-grade construction, including foundations, tunnels, basements, and water-retaining structures like dams and reservoirs. Its effectiveness lies in its ability to self-seal cracks and gaps, ensuring long-term waterproofing without requiring adhesives or mechanical fastening. The material is typically manufactured in strips, sheets, or ropes, allowing for easy installation in various joint configurations. Its performance is influenced by factors such as bentonite quality, density, and the presence of additives like polymers or fibers that enhance durability and swelling capacity. As a passive sealing solution, bentonite waterstop is valued for its reliability in both new construction and repair applications, offering resistance to hydrostatic pressure and chemical exposure while maintaining structural integrity over time.
