Report Overview

Biaxial cross-flow blades are a blade design used in blowers or fans. It is characterized by air flow on both axes of the blade, that is, airflow passes through both sides of the blade. This design improves the efficiency and performance of the blower or fan. In traditional fan blade designs, airflow can only enter the blade from one side and then turn to the other side through the curved shape of the blade. The biaxial cross-flow fan blade is equipped with air inlets on both sides of the blade, so that the airflow can enter the blade from two directions at the same time and pass inside the blade. The design of the biaxial cross-flow fan blades can increase the penetration and flow rate of the airflow and improve the air supply effect of the fan or fan. It also reduces noise and vibration, improving overall operational smoothness.
