Report Overview

A Bifurcated Covered Stent is a medical device used in interventional cardiology and vascular surgery, specifically designed for treating bifurcation lesions in blood vessels. This advanced stent features a unique design that allows for the simultaneous treatment of both the main vessel and the side branch, addressing the complex geometry of bifurcated lesions. The stent is covered with a biocompatible material, typically a thin layer of fabric or membrane, which helps prevent the re-narrowing of the vessel after stent placement by inhibiting the growth of scar tissue. The bifurcated covered stent is implanted using a minimally invasive procedure, where it is delivered to the lesion site via a catheter and then expanded to restore blood flow. This device plays a crucial role in improving patient outcomes by reducing the risk of restenosis and enhancing the durability of the treatment.
