Report Overview

The Bike Pedal Assist Sensor (PAS) is an electronic device integrated into electric bicycles (e-bikes) that detects pedaling motion and torque, signaling the motor to provide proportional assistance based on rider input. It enhances cycling efficiency by reducing physical strain while maintaining a natural riding experience, making it a key component in modern e-bike systems. PAS sensors typically use cadence-based (measuring pedal rotations) or torque-based (measuring applied force) mechanisms, with torque sensors offering more responsive and intuitive assistance. The technology appeals to commuters, recreational cyclists, and fitness enthusiasts by blending human effort with electric power, aligning with trends toward sustainable mobility and active transportation. The sensor's accuracy, durability, and compatibility with various e-bike drivetrains are critical factors influencing its adoption and market demand.
