Report Overview

Bile Acid Sequestrant, also known as bile acid-binding resins, is a class of medications used primarily for the treatment of hypercholesterolemia, a condition characterized by elevated levels of cholesterol in the blood. These medications work by binding to bile acids in the intestine, preventing their reabsorption into the bloodstream. As a result, the liver uses cholesterol to produce more bile acids, leading to a reduction in circulating cholesterol levels. Bile acid sequestrants are typically prescribed as an adjunct to diet and exercise in patients with high cholesterol who do not respond adequately to statin therapy alone. They are also used in certain cases to manage cholesterol levels in patients with liver disease or those who cannot tolerate other cholesterol-lowering medications. Examples of bile acid sequestrants include cholestyramine, colestipol, and colesevelam.

In 2024, the global Bile Acid Sequestrant market is projected to reach approximately USD xx Million, with expectations to grow at a compound annual growth rate (CAGR) of around xx between 2024 and 2033.
