Report Overview

The biliary double-lumen catheter is a specialized medical device designed for diagnostic and therapeutic procedures involving the biliary system, primarily used in interventional radiology, gastroenterology, and hepatobiliary surgery. It features two separate lumens—one for drainage and another for contrast injection or irrigation—enabling simultaneous drainage and imaging during procedures such as percutaneous transhepatic cholangiography (PTC) or bile duct interventions. These catheters are typically made from biocompatible materials like polyurethane or silicone to ensure flexibility and minimize tissue irritation. Their design allows for efficient bile collection, stent placement, or stricture dilation while reducing the risk of infection or obstruction. The market for biliary double-lumen catheters is driven by the rising prevalence of biliary disorders, including cholangiocarcinoma, gallstones, and strictures, alongside advancements in minimally invasive techniques. Demand is further supported by the growing adoption of image-guided procedures and the increasing geriatric population susceptible to biliary complications. However, challenges such as reimbursement limitations and the need for specialized training for proper catheter placement may restrict market growth. Geographically, developed regions with advanced healthcare infrastructure dominate adoption, while emerging economies are witnessing gradual uptake due to improving access to interventional procedures.
