### Report Overview

The bimetallic stick thermometer is a mechanical temperature measuring device that utilizes the differential expansion of two bonded metal strips (typically brass and steel) to indicate temperature changes. The bimetallic coil or helix inside the probe rotates as the metals expand or contract at different rates, translating thermal energy into mechanical movement of an attached pointer along a calibrated scale. These thermometers are valued for their durability, simplicity, and ability to function without external power, making them widely used in industrial processes (e.g., HVAC, manufacturing), food service (e.g., cooking, refrigeration), and laboratory applications where moderate accuracy (±2% of full scale) suffices. Their cost-effectiveness, resistance to vibration, and broad operating range (50°C to 500°C+) sustain demand despite competition from digital alternatives, particularly in harsh environments or settings requiring minimal maintenance.

This report provides a deep insight into the global Bimetal Stick Thermometer market covering all its essential aspects.
