### Report Overview

A Bimetallic Overload Relay is an electrical protection device designed to safeguard motors, generators, and other electrical equipment from damage due to excessive current or temperature. It functions by utilizing a bimetallic strip, which is a composite material made from two different metals bonded together. When the temperature or current exceeds the predetermined threshold, the strip bends due to the differential expansion rates of the two metals, triggering a mechanical switch that interrupts the power supply to the protected equipment. This action prevents overheating and potential damage to the motor or generator, ensuring reliable operation and extending the lifespan of the equipment. The bimetallic overload relay is a critical component in electrical systems, providing a reliable and automatic means of protection against overload conditions.
