Report Overview

A Bimetallic Temperature Switch is a type of temperature control device that utilizes the differential expansion properties of two different metals bonded together to detect and respond to temperature changes. This device typically consists of a bimetallic strip made from two metals with different coefficients of thermal expansion. As the temperature changes, the strip bends due to the differing expansion rates of the two metals, causing a mechanical movement. This movement is then used to trigger a switch or relay, which can control a circuit or activate a safety mechanism. Bimetallic temperature switches are commonly used in various applications, such as industrial processes, HVAC systems, and appliances, to provide reliable and precise temperature control. They are known for their durability, low cost, and simple design, making them a popular choice for many temperature monitoring and control applications.
