Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Bio-based Methylene Diphenyl Diisocyanate (MDI) competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Bio-based Methylene Diphenyl Diisocyanate (MDI) is produced by using renewable biomass raw materials (such as plant waste and starch-based polyether polyols) to partially or completely replace traditional petroleum-based raw materials. Bio-based MDI has the advantages of being green, environmentally friendly, energy-saving and emission-reducing. It is widely used in the manufacture of bio-based polyurethanes and is applied in the fields of construction, automobiles, etc. At present, the source of MDI is mainly petrochemical raw materials, and its production processes are mainly phosgenation and non-phosgenation. Most companies in the world mainly use the phosgenation method, but phosgenation is a highly toxic gas, which has high requirements for equipment and is easy to cause environmental pollution, posing a great safety hazard. With the increasing global demand for sustainable solutions, bio-based MDI, as a substitute for traditional petrochemical MDI, has become a key step in reducing the carbon footprint of polyurethane production. Due to the wide application of MDI and the expansion of the scale of the bio-based polyurethane industry, bio-based MDI, as a key raw material for bio-based polyurethane, has become an inevitable trend in the context of "dual carbon" and green and low-carbon development. In the future, the market size of bio-based MDI will gradually expand.

The global Bio-based Methylene Diphenyl Diisocyanate (MDI) market size was estimated at USD 234.0 million in 2025 and is projected to grow at a compound annual

growth rate (CAGR) of 18.00% during the forecast period.
