Abstracts

Bio-based polyethylene furanyl dicarboxylate (PEF) is a 100% recyclable bio-based polymer produced from renewable raw materials derived from plants. Called the next generation of polyesters, PEF has great potential to replace polyethylene terephthalate (PET), a durable polymer derived from traditional synthetic resources. PEF is still an emerging material and no manufacturer has yet commercialized it. The synthesis technology of PEF and its key monomers is still very challenging and has not yet been industrialized; at the same time, studies of PE structural properties have shown some deficiencies in its performance and modifications are needed to facilitate the processing and application of PEF. PEF offers many advantages over PET, such as superior oxygen and carbon dioxide barriers, so it can keep food and beverages fresher longer by blocking the entry of oxygen and CO₂; it is lightweight, has excellent mechanical and thermal properties, and is potentially cost-competitive on an industrial scale over the long term. However, today there are no PEF bottles per se, and disrupting PET will require not only new material production routes and capabilities, but also new conversion and recycling methods and capabilities.

The global Bio Based Polyethylene Furanoate Pef market size was estimated at USD 280.45 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.65% during the forecast period.
