Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Bio-based Resin Carbon Fiber Prepreg competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Bio-based resin carbon fiber prepreg is a carbon-fiber reinforced intermediate material in which the matrix resin contains a significant share of renewable, bio-based content (typically 10-80% bio-carbon in the resin, sometimes higher), while the reinforcement is conventional PAN-based or recycled carbon fiber. Typical chemistries include bio-based epoxy systems, plant-derived epoxy blends, furan resins from sugar-cane by-products, and bio-based thermoplastics such as PA11 and PPA. Upstream, these prepregs depend on high-grade carbon fibers, bio-based resin building blocks, curing agents, tougheners and flame-retardant packages tuned to meet FST and mechanical requirements, and conventional prepreg auxiliaries. Downstream, bio-based resin carbon fiber prepregs are already used in aircraft and rail interior panels, automotive structural and body parts, winter-sports equipment, marine structures, and are being evaluated for wind turbine components and hydrogen storage tanks, where sustainability and life-cycle CO₂ reduction are becoming primary design drivers. In 2024, global sales of bio-based resin carbon fiber prepreg reached approximately 2,787 tons, with an average global market price of around US\$ 86/kg. Production capacity varies significantly among manufacturers, with gross profit margins ranging from approximately 20% to 40%. From an overall perspective, bio-based resin carbon fiber prepregs remain a relatively new and niche category within the carbon fiber prepreg market, but their growth rate is significantly faster than that of traditional systems. Current demand primarily comes from aerospace, automotive and new energy transportation, wind power, electronics, and sports and leisure sectors. These downstream industries value the advantages of carbon fiber in terms of specific

strength, specific stiffness, and fatigue performance, and are increasingly concerned about the resin system's performance in terms of raw material sourcing, carbon footprint, and recyclability. The Asia-Pacific region, Europe, and North America constitute the three major demand hubs. Among them, Asia-Pacific countries, such as China, are showing rapid growth in acceptance of low-carbon prepregs driven by policies promoting new energy vehicles, energy storage, and high-end manufacturing. Since most bio-based epoxy and furan resin systems are designed as "plug-and-play" solutions compatible with existing autoclave or molding processes, end-use composite material companies can switch to lower-carbon prepreg systems without significant adjustments to processes and equipment, significantly lowering the barrier to entry. With increasingly stringent policy constraints on embodied carbon and downstream OEMs more actively specifying low-carbon materials for new platforms, bio-based resin carbon fiber prepregs are expected to gradually evolve from current demonstration and small-batch projects into a regular option for interior components, secondary load-bearing structures, and high-value-added sports and new energy components.

The global Bio-based Resin Carbon Fiber Prepreg market size was estimated at USD 240.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 16.20% during the forecast period.
