Abstracts

Bioabsorbable implants in orthopaedics are medical devices used to support the healing of bones, ligaments, and tissues after fractures, injuries, or surgeries. These implants are made from materials such as polylactic acid (PLA), polyglycolic acid (PGA), or other biocompatible polymers that gradually dissolve and are absorbed by the body over time, eliminating the need for a second surgery to remove the implant. Bioabsorbable implants provide temporary support to the injured area while the body heals, allowing for natural tissue regeneration and reducing the risk of long-term complications associated with metal implants, such as infection or irritation. They are commonly used in procedures like fracture fixation, tendon repairs, and ligament reconstructions.

The global Bioabsorbable Implants In Orthopaedics market size was estimated at USD 1250.45 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
