Abstracts

Bioabsorbable materials in orthopaedics are specialized materials used in medical devices, such as screws, pins, plates, and sutures, that naturally dissolve and are absorbed by the body over time. These materials are primarily used in orthopedic surgeries to repair bones, ligaments, and tendons. Unlike traditional metal implants, which may require removal after healing, bioabsorbable implants gradually break down as the tissue heals, eliminating the need for a second surgery. These materials are typically made from polymers like polylactic acid (PLA), polyglycolic acid (PGA), or polydioxanone (PDO), and they support healing while reducing the risk of long-term complications, such as infection or implant migration. Bioabsorbable materials are widely used in fracture fixation, ACL reconstructions, and other orthopedic procedures.

The global Bioabsorbable Materials In Orthopaedics market size was estimated at USD 4850.25 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
