### Report Overview

Bioabsorbable nails are a type of orthopedic implant designed for the fixation of fractures, particularly in long bones such as the femur and tibia. These nails are made from biocompatible and biodegradable materials, such as polylactic acid (PLA) or polyglycolic acid (PGA), which gradually break down and are absorbed by the body over time. The primary advantage of bioabsorbable nails is that they eliminate the need for a secondary surgery to remove the implant, reducing the risk of complications and patient discomfort. They provide temporary mechanical support to the healing bone, allowing for controlled movement and promoting bone union. As the nail is absorbed, the body's natural bone remodeling process takes over, leading to a complete integration of the bone segments. This technology is particularly beneficial in pediatric orthopedics, where growth plates must be preserved, and in cases where metal implants may interfere with imaging or future surgeries.
