### Report Overview

Bioactive films are a type of advanced materials used in various industries, particularly in food packaging and biomedical applications. These films are engineered to possess specific biological activities that can interact with the environment or the substances they come into contact with. They are typically composed of natural or synthetic polymers that have been modified to incorporate bioactive compounds, such as antimicrobial agents, antioxidants, or other functional molecules. The primary function of bioactive films is to extend the shelf life of food products by inhibiting microbial growth, reducing oxidation, and maintaining freshness. In biomedical applications, these films can be used for controlled drug release, tissue engineering, and wound healing due to their ability to deliver bioactive molecules directly to the target site. The development of bioactive films involves a deep understanding of material science, polymer chemistry, and the specific requirements of the application, ensuring that the films are not only effective but also safe and environmentally friendly.
