Abstracts

Biodegradable Microfibrillated Cellulose (MFC) is a sustainable and eco-friendly material derived from cellulose fibers, typically sourced from renewable biomass such as wood pulp or agricultural waste. MFC is produced through a mechanical or chemical process that breaks down cellulose fibers into nano-sized fibrils, resulting in a highly fibrillated and interconnected network structure. This unique morphology gives MFC exceptional mechanical properties, such as high strength, stiffness, and aspect ratio, as well as a large surface area and high water retention capacity. Due to its biodegradability, biocompatibility, and renewable origin, MFC finds applications in a wide range of industries, including packaging, paper and board manufacturing, textiles, coatings, cosmetics, and biomedical materials. MFC can be used as a sustainable alternative to synthetic additives and fillers in various products, contributing to the reduction of environmental impact and the transition towards a circular economy.

The global Biodegradable Microfibrillated Cellulose market size was estimated at USD 285.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.65% during the forecast period.
