Report Overview

Biogas primarily consists of methane, carbon dioxide, hydrogen sulphide, moisture and siloxanes. It is purified, processed and liquefied to be used as a fuel. This process is called as liquefaction of biogas. In a biogas liquefaction plant, purified and upgraded biogas is converted to liquefied biogas under specific pressure and temperature. Purest kind of liquid biogas consists of approximately 97% methane. Liquefied biogas is approximately 600 times more space competent than in gaseous state; it is much easier to transport liquefied biogas. Liquefied biogas is produced in two main ways such as cryogenic technology and conventional upgrading technology. Certain procedures such as biogas production, pre-treatment, liquefaction, storage and transport are carried out in a biogas liquefaction plant.
