Report Overview

Biologic response modifiers (BRMs) are a diverse group of naturally occurring or synthetically produced substances that are designed to enhance, suppress, or modulate the body's immune response. These agents work by interacting with various components of the immune system, such as cells, cytokines, or receptors, to either stimulate or inhibit their function. BRMs are used in the treatment of various diseases, including cancer, autoimmune disorders, and infectious diseases. They can be classified into several categories, including cytokines, monoclonal antibodies, vaccines, and immune checkpoint inhibitors. The primary goal of using BRMs is to achieve a more targeted and effective therapeutic outcome by harnessing the body's own immune system to combat disease.
