Report Overview

Biomass-Based Precursors are raw materials derived from biological sources, such as plants, animals, and microorganisms, that are used as the starting point for the production of various chemicals, materials, and fuels. These precursors are an essential component in the bioeconomy, as they provide a sustainable and renewable alternative to traditional fossil-based feedstocks. The use of biomass-based precursors helps reduce greenhouse gas emissions, decrease dependence on non-renewable resources, and promote a circular economy. Examples of biomass-based precursors include cellulose, lignin, and starch, which can be converted into bioplastics, biofuels, and other bio-based products through various chemical and biological processes.
