Report Overview

A biomass combustion system burns renewable biomass fuel (e.g., wood, field crops) to produce heat. Commercial-scale systems are different from smaller residential systems in that they typically (1) incorporate automated feed and control systems and (2) require emissions control equipment to ensure that strict emissions regulations are met. If the combustor generates steam or hot water, it is often called a "boiler." If it generates hot air, it is called a "furnace."
