### Report Overview

A Biosafety Level 3 Laboratory (BSL-3) is a high-containment facility specifically designed to handle infectious agents that pose a serious or potentially lethal risk to humans and the environment. These laboratories are equipped with stringent safety measures to prevent the release of harmful pathogens, including negative air pressure systems, airlocks, and specialized containment equipment such as biosafety cabinets and protective clothing. BSL-3 labs are used for research and diagnostic work involving pathogens that can be transmitted through the air and for which there is no vaccine or treatment available. Examples of such pathogens include certain strains of influenza, West Nile virus, and HIV. The primary objective of BSL-3 labs is to ensure the safety of both the personnel working within the facility and the surrounding community while enabling critical research and diagnostics to be conducted on dangerous pathogens.
