### Report Overview

A biosimilar is a biological product that is highly similar to and has no clinically meaningful differences from an existing FDA-approved biological product, known as the reference product. Biosimilars are developed to provide an alternative to the original biological product, which is often a high-cost treatment. They are approved by regulatory agencies, such as the FDA, based on a demonstration of similarity in terms of safety, purity, and potency to the reference product. This approval process includes a comprehensive evaluation of the biosimilar's structure, function, animal studies, human pharmacokinetic and pharmacodynamic data, and clinical efficacy and safety. Biosimilars offer the potential for cost savings in healthcare systems, as they are generally less expensive than the original biologics, while still maintaining the same therapeutic benefits.
