Report Overview

Biostimulators are a breakthrough in aesthetic medicine, which naturally encourage the production of collagen. Elastin and collagen are the ?scaffolding? of the face and as they diminish with age, we lose structure and elasticity. Biocompatible synthetic stimulants are injected beneath the surface of the skin and serve to restore volume, thus rejuvenating and improving skin quality and appearance. The injectables function by stimulating the production of the body?s natural fibroblast - cells which create collagen and elastin. Once the cycle is complete and the collagen production has occurred (along with all components of the extracellular matrix) the biodegradable synthetic substances are then naturally absorbed by the body.
